

FDA PROVIDES 510(k) CLEARANCE FOR ACUITY 200 DAILY WEAR GAS PERMEABLE CONTACT LENSES

ROCHESTER, N.Y. (USA), September 8, 2020 – Acuity Polymers, a leading developer of contact lens materials, today announced that it has received 510(k) clearance from the U.S. Food and Drug Administration (FDA) for ACUITY 200™ daily wear gas permeable contact lenses, in a variety of designs and indications.

ACUITY 200 contact lenses are produced from a next generation contact lens material (fluoroxfocon A) and feature the highest gas permeability of any contact lenses on the market. Engineered using Acuity Polymers' recently patented ultra Dk technology, ACUITY 200 offers exceptional permeability and wettability for healthy lens wear while providing excellent all-day comfort, whether in a scleral or corneal lens design.

“The FDA 510(k) clearance of ACUITY 200 provides specialty contact lens fitters with the highest Dk GP material to address the significant oxygen permeability needs of large diameter contact lens wearers” said Jim Bonafini, President of Acuity Polymers, Inc. “We’re excited to bring to market the first new GP material in ages, one that provides substantial advantages for patient eye health and wearing comfort.”

About Acuity Polymers, Inc.:

The company is focused on providing the best of class materials for specialty vision products around the globe. Acuity Polymers is dedicated to creating new material solutions for protection of ocular health and vision. Acuity Polymers is an ISO 13485:2016 certified, privately held company, headquartered in Rochester, NY (USA) and has global distribution through a network of specialty lens manufacturers.
